INTRODUCTION

python-chess is a pure Python chess library with move generation, move validation and support for common formats. This is the Scholar's mate in python-chess:

```
>>> import chess
>>> board = chess.Board()
>>> board.legal_moves
<LegalMoveGenerator at ... (Nh3, Nf3, Nc3, Na3, h3, g3, f3, e3, d3, c3, ...)>
>>> chess.Move.from_uci("a8a1") in board.legal_moves
False
>>> board.push_san("e4")
Move.from_uci('e2e4')
>>> board.push_san("e5")
Move.from_uci('e7e5')
>>> board.push_san("Qh5")
Move.from_uci('d1h5')
>>> board.push_san("Nc6")
Move.from_uci('b8c6')
>>> board.push_san("Bc4")
Move.from_uci('f1c4')
>>> board.push_san("Nf6")
Move.from_uci('g8f6')
>>> board.push_san("Qxf7")
Move.from_uci('h5f7')
>>> board.is_checkmate()
True
>>> board
```

TWO

DOCUMENTATION

- Core
- PGN parsing and writing
- Polyglot opening book reading
- Gaviota endgame tablebase probing
- Syzygy endgame tablebase probing
- UCI/XBoard engine communication
- Variants
- Changelog

THREE

FEATURES

- Supports Python 3.7+. Includes mypy typings.
- IPython/Jupyter Notebook integration. SVG rendering docs.

>>> board

- Chess variants: Standard, Chess960, Suicide, Giveaway, Atomic, King of the Hill, Racing Kings, Horde, Three-check, Crazyhouse. Variant docs.
- Make and unmake moves.

```
>>> Nf3 = chess.Move.from_uci("g1f3")
>>> board.push(Nf3) # Make the move

>>> board.pop() # Unmake the last move
Move.from_uci('g1f3')
```

Show a simple ASCII board.

• Detects checkmates, stalemates and draws by insufficient material.

```
>>> board.is_stalemate()
False
>>> board.is_insufficient_material()
False
>>> board.is_game_over()
True
```

• Detects repetitions. Has a half-move clock.

```
>>> board.can_claim_threefold_repetition()
False
>>> board.halfmove_clock
0
>>> board.can_claim_fifty_moves()
False
>>> board.can_claim_draw()
False
```

With the new rules from July 2014, a game ends as a draw (even without a claim) once a fivefold repetition occurs or if there are 75 moves without a pawn push or capture. Other ways of ending a game take precedence.

```
>>> board.is_fivefold_repetition()
False
>>> board.is_seventyfive_moves()
False
```

· Detects checks and attacks.

8

```
>>> board.is_check()
True
>>> board.is_attacked_by(chess.WHITE, chess.E8)
True
>>> attackers = board.attackers(chess.WHITE, chess.F3)
>>> attackers
```

(continues on next page)

(continued from previous page)

• Parses and creates SAN representation of moves.

• Parses and creates FENs, extended FENs and Shredder FENs.

· Parses and creates EPDs.

- Detects absolute pins and their directions.
- Reads Polyglot opening books. Docs.

```
>>> import chess.polyglot
>>> book = chess.polyglot.open_reader("data/polyglot/performance.bin")
>>> board = chess.Board()
>>> main_entry = book.find(board)
>>> main_entry.move
Move.from_uci('e2e4')
```

(continues on next page)

(continued from previous page)

```
>>> main_entry.weight
1
>>> book.close()
```

• Reads and writes PGNs. Supports headers, comments, NAGs and a tree of variations. Docs.

```
>>> import chess.pgn
>>> with open("data/pgn/molinari-bordais-1979.pgn") as pgn:
... first_game = chess.pgn.read_game(pgn)
>>> first_game.headers["White"]
'Molinari'
>>> first_game.headers["Black"]
'Bordais'
>>> first_game.mainline()
<Mainline at ... (1. e4 c5 2. c4 Nc6 3. Ne2 Nf6 4. Nbc3 Nb4 5. g3 Nd3#)>
>>> first_game.headers["Result"]
'0-1'
```

- Probe Gaviota endgame tablebases (DTM, WDL). Docs.
- Probe Syzygy endgame tablebases (DTZ, WDL). Docs.

```
>>> import chess.syzygy
>>> tablebase = chess.syzygy.open_tablebase("data/syzygy/regular")
>>> # Black to move is losing in 53 half moves (distance to zero) in this
>>> # KNBvK endgame.
>>> board = chess.Board("8/2K5/4B3/3N4/8/8/4k3/8 b - - 0 1")
>>> tablebase.probe_dtz(board)
-53
>>> tablebase.close()
```

• Communicate with UCI/XBoard engines. Based on asyncio. Docs.

10 Chapter 3. Features

CHAPTER FOUR

INSTALLING

Download and install the latest release:

pip install python-chess

FIVE

SELECTED USE CASES

If you like, let me know if you are creating something interesting with python-chess, for example:

- a stand-alone chess computer based on DGT board http://www.picochess.org/
- a website to probe Syzygy endgame tablebases https://syzygy-tables.info/
- deep learning for Crazyhouse https://github.com/QueensGambit/CrazyAra
- a bridge between Lichess API and chess engines https://github.com/careless25/lichess-bot
- a command-line PGN annotator https://github.com/rpdelaney/python-chess-annotator
- an HTTP microservice to render board images https://github.com/niklasf/web-boardimage
- a JIT compiled chess engine https://github.com/SamRagusa/Batch-First
- a GUI to play against UCI chess engines http://johncheetham.com/projects/jcchess/
- teaching Cognitive Science https://jupyter.brynmawr.edu
- an Alexa skill to play blindfold chess https://github.com/laynr/blindfold-chess
- a chessboard widget for PySide2 https://github.com/H-a-y-k/hichesslib
- Django Rest Framework API for multiplayer chess https://github.com/WorkShoft/capablanca-api
- a multi-agent reinforcement learning environment https://github.com/PettingZoo-Team/PettingZoo / https://www.pettingzoo.ml/classic/chess

SIX

ACKNOWLEDGEMENTS

Thanks to the Stockfish authors and thanks to Sam Tannous for publishing his approach to avoid rotated bitboards with direct lookup (PDF) alongside his GPL2+ engine Shatranj. Some move generation ideas are taken from these sources.

Thanks to Ronald de Man for his Syzygy endgame tablebases. The probing code in python-chess is very directly ported from his C probing code.

SEVEN

LICENSE

python-chess is licensed under the GPL 3 (or any later version at your option). Check out LICENSE.txt for the full text.

EIGHT

CONTENTS

8.1 Core

8.1.1 Colors

Constants for the side to move or the color of a piece.

```
chess.WHITE: chess.Color = True
chess.BLACK: chess.Color = False
You can get the opposite color using not color.
```

8.1.2 Piece types

```
chess.PAWN: chess.PieceType = 1
chess.KNIGHT: chess.PieceType = 2
chess.BISHOP: chess.PieceType = 3
chess.ROOK: chess.PieceType = 4
chess.QUEEN: chess.PieceType = 5
chess.KING: chess.PieceType = 6
chess.piece_symbol(piece_type: chess.PieceType) → str
chess.piece_name(piece_type: chess.PieceType) → str
```

8.1.3 Squares

```
chess.A1: chess.Square = 0
chess.B1: chess.Square = 1
and so on to
chess.G8: chess.Square = 62
chess.H8: chess.Square = 63
chess.SQUARES = [chess.A1, chess.B1, ..., chess.G8, chess.H8]
chess.SQUARE_NAMES = ['a1', 'b1', ..., 'g8', 'h8']
chess.FILE_NAMES = ['a', 'b', ..., 'g', 'h']
```

```
chess.RANK_NAMES = ['1', '2', ..., '7', '8']
chess.parse_square (name: str) \rightarrow chess.Square
     Gets the square index for the given square name (e.g., a1 returns 0).
           Raises ValueError if the square name is invalid.
chess.square name (square: chess.Square) \rightarrow str
     Gets the name of the square, like a3.
chess.square (file_index: int, rank_index: int) \rightarrow chess.Square
     Gets a square number by file and rank index.
chess.square_file (square: chess.Square) \rightarrow int
     Gets the file index of the square where 0 is the a-file.
chess.square_rank (square: chess.Square) \rightarrow int
     Gets the rank index of the square where 0 is the first rank.
\texttt{chess.Square}, \textit{b: chess.Square}, \textit{b: chess.Square}) \rightarrow \texttt{int}
     Gets the distance (i.e., the number of king steps) from square a to b.
chess.square_mirror(square: chess.Square) \rightarrow chess.Square
     Mirrors the square vertically.
8.1.4 Pieces
class chess.Piece (piece type: chess.PieceType, color: chess.Color)
     A piece with type and color.
     piece_type: chess.PieceType
           The piece type.
     color:
                 chess.Color
           The piece color.
     symbol() \rightarrow str
           Gets the symbol P, N, B, R, Q or K for white pieces or the lower-case variants for the black pieces.
     unicode_symbol(*, invert\_color: bool = False) \rightarrow str
           Gets the Unicode character for the piece.
     classmethod from_symbol (symbol: str) \rightarrow chess.Piece
           Creates a Piece instance from a piece symbol.
               Raises ValueError if the symbol is invalid.
8.1.5 Moves
class chess.Move(from_square:
                                         chess.Square, to_square:
                                                                       chess.Square, promotion:
                                                                                                       Op-
                        tional[chess.PieceType] = None, drop: Optional[chess.PieceType] = None)
     Represents a move from a square to a square and possibly the promotion piece type.
     Drops and null moves are supported.
     from_square: chess.Square
           The source square.
     to_square: chess.Square
           The target square.
```

```
promotion: Optional[chess.PieceType] = None
```

The promotion piece type or None.

drop: Optional[chess.PieceType] = None

The drop piece type or None.

```
uci() \rightarrow str
```

Gets a UCI string for the move.

For example, a move from a7 to a8 would be a7a8 or a7a8q (if the latter is a promotion to a queen).

The UCI representation of a null move is 0000.

```
classmethod from_uci(uci: str) \rightarrow chess.Move
```

Parses a UCI string.

Raises ValueError if the UCI string is invalid.

```
classmethod null() \rightarrow chess.Move
```

Gets a null move.

A null move just passes the turn to the other side (and possibly forfeits en passant capturing). Null moves evaluate to False in boolean contexts.

```
>>> import chess
>>>
>>> bool(chess.Move.null())
False
```

8.1.6 Board

```
chess.STARTING_BOARD_FEN = 'rnbqkbnr/pppppppp/8/8/8/8/PPPPPPPPP/RNBQKBNR'
The board part of the FEN for the standard chess starting position.
```

class chess.Board(fen: Optional[str] = 'rnbqkbnr/ppppppppp/8/8/8/8/PPPPPPPPRNBQKBNR w KQkq

- 0 1', *, chess960: bool = False)

A BaseBoard, additional information representing a chess position, and a move stack.

Provides move generation, validation, parsing, attack generation, game end detection, and the capability to make and unmake moves.

The board is initialized to the standard chess starting position, unless otherwise specified in the optional *fen* argument. If *fen* is None, an empty board is created.

Optionally supports *chess960*. In Chess960, castling moves are encoded by a king move to the corresponding rook square. Use *chess.Board.from_chess960_pos()* to create a board with one of the Chess960 starting positions.

It's safe to set turn, castling_rights, ep_square, halfmove_clock and fullmove_number directly.

Warning: It is possible to set up and work with invalid positions. In this case, *Board* implements a kind of "pseudo-chess" (useful to gracefully handle errors or to implement chess variants). Use *is_valid()* to detect invalid positions.

turn: chess.Color

The side to move (chess.WHITE or chess.BLACK).

castling_rights: chess.Bitboard

Bitmask of the rooks with castling rights.

To test for specific squares:

To add a specific square:

```
>>> board.castling_rights |= chess.BB_A1
```

```
Use set_castling_fen() to set multiple castling rights. Also see has_castling_rights(), has_kingside_castling_rights(), has_queenside_castling_rights(), has_chess960_castling_rights(), clean_castling_rights().
```

fullmove number: int

Counts move pairs. Starts at 1 and is incremented after every move of the black side.

halfmove_clock: int

The number of half-moves since the last capture or pawn move.

promoted: chess.Bitboard

A bitmask of pieces that have been promoted.

chess960: bool

Whether the board is in Chess960 mode. In Chess960 castling moves are represented as king moves to the corresponding rook square.

ep_square: Optional[chess.Square]

The potential en passant square on the third or sixth rank or None.

Use has_legal_en_passant () to test if en passant capturing would actually be possible on the next move.

move_stack: List[chess.Move]

The move stack. Use Board.push(), Board.pop(), Board.peek() and Board.clear_stack() for manipulation.

property legal_moves

A dynamic list of legal moves.

```
>>> import chess
>>>
>>> board = chess.Board()
>>> board.legal_moves.count()
20
>>> bool(board.legal_moves)
True
>>> move = chess.Move.from_uci("g1f3")
>>> move in board.legal_moves
True
```

Wraps generate_legal_moves() and is_legal().

property pseudo_legal_moves

A dynamic list of pseudo-legal moves, much like the legal move list.

Pseudo-legal moves might leave or put the king in check, but are otherwise valid. Null moves are not pseudo-legal. Castling moves are only included if they are completely legal.

```
Wraps generate_pseudo_legal_moves() and is_pseudo_legal().
```

$\textbf{reset} \; (\,) \; \to None$

Restores the starting position.

$reset_board() \rightarrow None$

Resets only pieces to the starting position. Use reset () to fully restore the starting position (including turn, castling rights, etc.).

$\texttt{clear}() \rightarrow None$

Clears the board.

Resets move stack and move counters. The side to move is white. There are no rooks or kings, so castling rights are removed.

In order to be in a valid status (), at least kings need to be put on the board.

clear board() \rightarrow None

Clears the board.

clear stack() \rightarrow None

Clears the move stack.

$root() \rightarrow BoardT$

Returns a copy of the root position.

$ply() \rightarrow int$

Returns the number of half-moves since the start of the game, as indicated by fullmove_number and turn.

If moves have been pushed from the beginning, this is usually equal to len (board.move_stack). But note that a board can be set up with arbitrary starting positions, and the stack can be cleared.

```
remove_piece_at (square: chess.Square) → Optional[chess.Piece]
```

Removes the piece from the given square. Returns the Piece or None if the square was already empty.

Sets a piece at the given square.

An existing piece is replaced. Setting piece to None is equivalent to remove_piece_at ().

checkers() \rightarrow *chess.SquareSet*

Gets the pieces currently giving check.

```
Returns a set of squares.
```

is $check() \rightarrow bool$

Tests if the current side to move is in check.

```
gives_check (move: chess.Move) \rightarrow bool
```

Probes if the given move would put the opponent in check. The move must be at least pseudo-legal.

$\textbf{is_variant_end}\,(\,)\,\rightarrow bool$

Checks if the game is over due to a special variant end condition.

Note, for example, that stalemate is not considered a variant-specific end condition (this method will return False), yet it can have a special **result** in suicide chess (any of <code>is_variant_loss()</code>, <code>is_variant_win()</code>, <code>is_variant_draw()</code> might return True).

is variant loss() \rightarrow bool

Checks if the current side to move lost due to a variant-specific condition.

$is_variant_win() \rightarrow bool$

Checks if the current side to move won due to a variant-specific condition.

is_variant_draw() → bool

Checks if a variant-specific drawing condition is fulfilled.

is game over (*, claim draw: bool = False) $\rightarrow bool$

Checks if the game is over due to checkmate, stalemate, insufficient material, the seventy five-move rule, five fold repetition or a variant end condition.

The game is not considered to be over by the fifty-move rule or threefold repetition, unless claim_draw is given. Note that checking the latter can be slow.

result (*, $claim_draw$: bool = False) \rightarrow str

Gets the game result.

1-0, 0-1 or 1/2-1/2 if the game is over. Otherwise, the result is undetermined: *.

is checkmate() \rightarrow bool

Checks if the current position is a checkmate.

$is_stalemate() \rightarrow bool$

Checks if the current position is a stalemate.

is_insufficient_material() → bool

Checks if neither side has sufficient winning material (has_insufficient_material()).

has insufficient material (color: chess.Color) \rightarrow bool

Checks if *color* has insufficient winning material.

This is guaranteed to return False if *color* can still win the game.

The converse does not necessarily hold: The implementation only looks at the material, including the colors of bishops, but not considering piece positions. So fortress positions or positions with forced lines may return False, even though there is no possible winning line.

$is_seventyfive_moves() \rightarrow bool$

Since the 1st of July 2014, a game is automatically drawn (without a claim by one of the players) if the half-move clock since a capture or pawn move is equal to or greater than 150. Other means to end a game take precedence.

$\textbf{is_fivefold_repetition} \, (\,) \, \to bool \,$

Since the 1st of July 2014 a game is automatically drawn (without a claim by one of the players) if a position occurs for the fifth time. Originally this had to occur on consecutive alternating moves, but this has since been revised.

$can_claim_draw() \rightarrow bool$

Checks if the player to move can claim a draw by the fifty-move rule or by threefold repetition.

Note that checking the latter can be slow.

$can_claim_fifty_moves() \rightarrow bool$

Checks if the player to move can claim a draw by the fifty-move rule.

Draw by the fifty-move rule can be claimed once the clock of halfmoves since the last capture or pawn move becomes equal or greater to 100, or if there is a legal move that achieves this. Other means of ending the game take precedence.

${\tt can_claim_threefold_repetition}\,(\,)\,\to bool$

Checks if the player to move can claim a draw by threefold repetition.

Draw by threefold repetition can be claimed if the position on the board occured for the third time or if such a repetition is reached with one of the possible legal moves.

Note that checking this can be slow: In the worst case scenario, every legal move has to be tested and the entire game has to be replayed because there is no incremental transposition table.

is_repetition (*count: int* = 3) \rightarrow bool

Checks if the current position has repeated 3 (or a given number of) times.

Unlike can_claim_threefold_repetition(), this does not consider a repetition that can be played on the next move.

Note that checking this can be slow: In the worst case, the entire game has to be replayed because there is no incremental transposition table.

```
push(move: chess.Move) \rightarrow None
```

Updates the position with the given *move* and puts it onto the move stack.

```
>>> import chess
>>>
>>> board = chess.Board()
>>>
>>> Nf3 = chess.Move.from_uci("g1f3")
>>> board.push(Nf3) # Make the move
```

```
>>> board.pop() # Unmake the last move
Move.from_uci('g1f3')
```

Null moves just increment the move counters, switch turns and forfeit en passant capturing.

Warning: Moves are not checked for legality. It is the caller's responsibility to ensure that the move is at least pseudo-legal or a null move.

```
pop() \rightarrow chess.Move
```

Restores the previous position and returns the last move from the stack.

Raises IndexError if the move stack is empty.

```
peek() \rightarrow chess.Move
```

Gets the last move from the move stack.

Raises IndexError if the move stack is empty.

```
find_move (from_square: chess.Square, to_square: chess.Square, promotion: Optional[chess.PieceType] = None) \rightarrow chess.Move
```

Finds a matching legal move for an origin square, a target square, and an optional promotion piece type.

For pawn moves to the backrank, the promotion piece type defaults to chess. QUEEN, unless otherwise specified.

Castling moves are normalized to king moves by two steps, except in Chess960.

Raises ValueError if no matching legal move is found.

```
has_pseudo_legal_en_passant() \rightarrow bool
```

Checks if there is a pseudo-legal en passant capture.

```
has\_legal\_en\_passant() \rightarrow bool
```

Checks if there is a legal en passant capture.

fen (*, shredder: bool = False, en_passant: Literal[legal, fen, xfen] = 'legal', promoted: Optional[bool] = None) → str Gets a FEN representation of the position.

A FEN string (e.g., rnbqkbnr/ppppppppp/8/8/8/8/PPPPPPPPPRNBQKBNR w KQkq - 0 1) consists of the board part board_fen(), the turn, the castling part (castling_rights), the en passant square (ep_square), the halfmove_clock and the fullmove_number.

Parameters

- **shredder** Use castling_shredder_fen() and encode castling rights by the file of the rook (like HAha) instead of the default castling_xfen() (like KQkq).
- en_passant By default, only fully legal en passant squares are included (has_legal_en_passant()). Pass fen to strictly follow the FEN specification (always include the en passant square after a two-step pawn move) or xfen to follow the X-FEN specification (has_pseudo_legal_en_passant()).
- **promoted** Mark promoted pieces like Q~. By default, this is only enabled in chess variants where this is relevant.
- $set_fen (fen: str) \rightarrow None$

Parses a FEN and sets the position from it.

Raises ValueError if syntactically invalid. Use *is_valid()* to detect invalid positions.

 $set_castling_fen (castling_fen: str) \rightarrow None$

Sets castling rights from a string in FEN notation like Qqk.

Raises ValueError if the castling FEN is syntactically invalid.

 $set_board_fen (fen: str) \rightarrow None$

Parses fen and sets up the board, where fen is the board part of a FEN.

Raises ValueError if syntactically invalid.

- **set_piece_map** (*pieces: Mapping[chess.Square*, chess.Piece]) \rightarrow None Sets up the board from a dictionary of *pieces* by square index.
- set chess960 pos (scharnagl: int) \rightarrow None

Sets up a Chess960 starting position given its index between 0 and 959. Also see from_chess960_pos().

chess960_pos (*, $ignore_turn: bool = False, ignore_castling: bool = False, ignore_counters: bool = True) <math>\rightarrow$ Optional[int]

Gets the Chess960 starting position index between 0 and 956, or None if the current position is not a Chess960 starting position.

By default, white to move (**ignore_turn**) and full castling rights (**ignore_castling**) are required, but move counters (**ignore counters**) are ignored.

epd (*, shredder: bool = False, en_passant: Literal[legal, fen, xfen] = 'legal', promoted: Optional[bool] = None, **operations: Union[None, str, int, float, chess.Move, Iterable[chess.Move]]) \rightarrow str Gets an EPD representation of the current position.

See fen () for FEN formatting options (shredder, ep_square and promoted).

EPD operations can be given as keyword arguments. Supported operands are strings, integers, finite floats, legal moves and None. Additionally, the operation pv accepts a legal variation as a list of moves. The operations am and bm accept a list of legal moves in the current position.

The name of the field cannot be a lone dash and cannot contain spaces, newlines, carriage returns or tabs.

hmvc and *fmvn* are not included by default. You can use:

26

 $set_epd(epd: str) \rightarrow Dict[str, Union[None, str, int, float, chess.Move, List[chess.Move]]]$ Parses the given EPD string and uses it to set the position.

If present, hmvc and fmvn are used to set the half-move clock and the full-move number. Otherwise, 0 and 1 are used.

Returns a dictionary of parsed operations. Values can be strings, integers, floats, move objects, or lists of moves.

Raises ValueError if the EPD string is invalid.

```
san (move: chess.Move) \rightarrow str
```

Gets the standard algebraic notation of the given move in the context of the current position.

```
lan(move: chess.Move) \rightarrow str
```

Gets the long algebraic notation of the given move in the context of the current position.

```
variation\_san(variation: Iterable[chess.Move]) \rightarrow str
```

Given a sequence of moves, returns a string representing the sequence in standard algebraic notation (e.g., 1. e4 e5 2. Nf3 Nc6 or 37...Bg6 38. fxg6).

The board will not be modified as a result of calling this.

Raises ValueError if any moves in the sequence are illegal.

```
parse san (san: str) \rightarrow chess.Move
```

Uses the current position as the context to parse a move in standard algebraic notation and returns the corresponding move object.

Ambiguous moves are rejected. Overspecified moves (including long algebraic notation) are accepted.

The returned move is guaranteed to be either legal or a null move.

Raises ValueError if the SAN is invalid, illegal or ambiguous.

```
push\_san(san: str) \rightarrow chess.Move
```

Parses a move in standard algebraic notation, makes the move and puts it onto the move stack.

Returns the move.

Raises ValueError if neither legal nor a null move.

```
uci (move: chess.Move, *, chess960: Optional[bool] = None) \rightarrow str Gets the UCI notation of the move.
```

chess960 defaults to the mode of the board. Pass True to force Chess960 mode.

```
parse uci (uci: str) \rightarrow chess.Move
```

Parses the given move in UCI notation.

Supports both Chess960 and standard UCI notation.

The returned move is guaranteed to be either legal or a null move.

Raises ValueError if the move is invalid or illegal in the current position (but not a null move).

```
push uci (uci: str) \rightarrow chess.Move
```

Parses a move in UCI notation and puts it on the move stack.

Returns the move.

Raises ValueError if the move is invalid or illegal in the current position (but not a null move).

```
push\_xboard(san: str) \rightarrow chess.Move
```

Parses a move in standard algebraic notation, makes the move and puts it onto the move stack.

Returns the move.

Raises ValueError if neither legal nor a null move.

is_en_passant (*move*: chess.Move) → bool

Checks if the given pseudo-legal move is an en passant capture.

is_capture (*move*: chess.Move) → bool

Checks if the given pseudo-legal move is a capture.

is_zeroing (*move*: chess.Move) → bool

Checks if the given pseudo-legal move is a capture or pawn move.

is_irreversible (*move*: chess.Move) → bool

Checks if the given pseudo-legal move is irreversible.

In standard chess, pawn moves, captures, moves that destroy castling rights and moves that cede en passant are irreversible.

This method has false-negatives with forced lines. For example, a check that will force the king to lose castling rights is not considered irreversible. Only the actual king move is.

is_castling (*move:* chess.Move) → bool

Checks if the given pseudo-legal move is a castling move.

is_kingside_castling (*move:* chess.Move) → bool

Checks if the given pseudo-legal move is a kingside castling move.

is_queenside_castling (move: chess.Move) → bool

Checks if the given pseudo-legal move is a queenside castling move.

clean_castling_rights() → chess.Bitboard

Returns valid castling rights filtered from castling_rights.

$has_castling_rights(color: chess.Color) \rightarrow bool$

Checks if the given side has castling rights.

has kingside castling rights (color: chess.Color) \rightarrow bool

Checks if the given side has kingside (that is h-side in Chess960) castling rights.

$has_queenside_castling_rights(color: chess.Color) \rightarrow bool$

Checks if the given side has queenside (that is a-side in Chess960) castling rights.

$\verb|has_chess960_castling_rights|()| \rightarrow bool|$

Checks if there are castling rights that are only possible in Chess960.

status() \rightarrow chess.Status

Gets a bitmask of possible problems with the position.

STATUS_VALID if all basic validity requirements are met. This does not imply that the position is actually reachable with a series of legal moves from the starting position.

Otherwise, bitwise combinations of: STATUS_NO_WHITE_KING, STATUS NO BLACK KING, STATUS TOO MANY KINGS, STATUS TOO MANY WHITE PAWNS,

```
STATUS_TOO_MANY_BLACK_PAWNS, STATUS_PAWNS_ON_BACKRANK, STATUS_TOO_MANY_WHITE_PIECES, STATUS_BAD_CASTLING_RIGHTS, STATUS_INVALID_EP_SQUARE, STATUS_OPPOSITE_CHECK, STATUS_EMPTY, STATUS_RACE_CHECK, STATUS_RACE_OVER, STATUS_RACE_MATERIAL, STATUS_TOO_MANY_CHECKERS.
```

$is_valid() \rightarrow bool$

Checks some basic validity requirements.

See status () for details.

transform (f: Callable[[chess.Bitboard], chess.Bitboard]) → BoardT

Returns a transformed copy of the board by applying a bitboard transformation function.

```
Available transformations include chess.flip_vertical(), chess.flip_horizontal(), chess.flip_diagonal(), chess.flip_anti_diagonal(), chess.shift_down(), chess.shift_up(), chess.shift_left(), and chess.shift_right().
```

Alternatively, apply_transform() can be used to apply the transformation on the board.

$mirror() \rightarrow BoardT$

Returns a mirrored copy of the board.

The board is mirrored vertically and piece colors are swapped, so that the position is equivalent modulo color. Also swap the "en passant" square, castling rights and turn.

Alternatively, apply_mirror() can be used to mirror the board.

```
copy (*, stack: Union[bool, int] = True) \rightarrow BoardT
```

Creates a copy of the board.

Defaults to copying the entire move stack. Alternatively, *stack* can be False, or an integer to copy a limited number of moves.

```
classmethod empty (*, chess960: bool = False) \rightarrow BoardT
```

Creates a new empty board. Also see clear().

```
classmethod from_epd (epd: str, *, chess960: bool = False) \rightarrow Tuple[BoardT, Dict[str, Union[None, str, int, float, chess.Move, List[chess.Move]]]] Creates a new board from an EPD string. See set\_epd().
```

Returns the board and the dictionary of parsed operations as a tuple.

classmethod from_chess960_pos(scharnagl: int) \rightarrow BoardT

Creates a new board, initialized with a Chess960 starting position.

```
>>> import chess
>>> import random
>>>
>>> board = chess.Board.from_chess960_pos(random.randint(0, 959))
```

class chess.BaseBoard (board_fen: Optional[str] = 'rnbqkbnr/ppppppppp/8/8/8/8/PPPPPPPPPRNBQKBNR')

A board representing the position of chess pieces. See Board for a full board with move generation.

The board is initialized with the standard chess starting position, unless otherwise specified in the optional board_fen argument. If board_fen is None, an empty board is created.

$reset_board() \rightarrow None$

Resets pieces to the starting position.

```
\textbf{clear\_board}\,(\,)\,\to None
```

Clears the board.

```
pieces (piece_type: chess.PieceType, color: chess.Color) → chess.SquareSet
    Gets pieces of the given type and color.
    Returns a set of squares.

piece_at (square: chess.Square) → Optional[chess.Piece]
    Gets the piece at the given square.

piece_type_at (square: chess.Square) → Optional[chess.PieceType]
    Gets the piece type at the given square.

color_at (square: chess.Square) → Optional[chess.Color]
    Gets the color of the piece at the given square.
```

 $king(color: chess.Color) \rightarrow Optional[chess.Square]$

Finds the king square of the given side. Returns None if there is no king of that color.

In variants with king promotions, only non-promoted kings are considered.

```
attacks (square: chess.Square) \rightarrow chess.SquareSet
Gets the set of attacked squares from the given square.
```

There will be no attacks if the square is empty. Pinned pieces are still attacking other squares.

```
Returns a set of squares.
```

is_attacked_by (*color: chess.Color, square: chess.Square*) \rightarrow bool Checks if the given side attacks the given square.

Pinned pieces still count as attackers. Pawns that can be captured en passant are not considered attacked.

```
attackers (color: chess.Color, square: chess.Square) \rightarrow chess.SquareSet Gets the set of attackers of the given color for the given square.
```

Pinned pieces still count as attackers.

```
Returns a set of squares.
```

 $\textbf{pin} (color: chess.Color, square: chess.Square) \rightarrow chess.SquareSet$

Detects an absolute pin (and its direction) of the given square to the king of the given color.

Returns a set of squares that mask the rank, file or diagonal of the pin. If there is no pin, then a mask of the entire board is returned.

```
is_pinned (color: chess.Color, square: chess.Square) \rightarrow bool Detects if the given square is pinned to the king of the given color.
```

remove_piece_at (square: chess.Square) → Optional[chess.Piece]

Removes the piece from the given square. Returns the Piece or None if the square was already empty.

An existing piece is replaced. Setting piece to None is equivalent to remove_piece_at ().

```
\textbf{board\_fen} \ (*, promoted: Optional[bool] = False) \ \rightarrow \text{str}
```

Gets the board FEN (e.g., rnbqkbnr/ppppppppp/8/8/8/8/PPPPPPPPP/RNBQKBNR).

 $set_board_fen (fen: str) \rightarrow None$

Parses fen and sets up the board, where fen is the board part of a FEN.

Raises ValueError if syntactically invalid.

```
piece_map() \rightarrow Dict[chess.Square, chess.Piece]
```

Gets a dictionary of pieces by square index.

set_piece_map (*pieces: Mapping[chess.Square*, chess.Piece]) \rightarrow None Sets up the board from a dictionary of *pieces* by square index.

 $set_chess960_pos(scharnagl: int) \rightarrow None$

Sets up a Chess960 starting position given its index between 0 and 959. Also see from_chess960_pos().

 ${\tt chess960_pos}\,()\,\rightarrow Optional[int]$

Gets the Chess960 starting position index between 0 and 959, or None.

unicode (*, invert_color: bool = False, borders: bool = False, empty_square: $str = ") \rightarrow str$ Returns a string representation of the board with Unicode pieces. Useful for pretty-printing to a terminal.

Parameters

- invert_color Invert color of the Unicode pieces.
- **borders** Show borders and a coordinate margin.

$transform(f: Callable[[chess.Bitboard], chess.Bitboard]) \rightarrow BaseBoardT$

Returns a transformed copy of the board by applying a bitboard transformation function.

```
Available transformations include chess.flip_vertical(), chess.flip_horizontal(), chess.flip_diagonal(), chess.flip_anti_diagonal(), chess.shift_down(), chess.shift_up(), chess.shift_left(), and chess.shift_right().
```

Alternatively, apply_transform() can be used to apply the transformation on the board.

$mirror() \rightarrow BaseBoardT$

Returns a mirrored copy of the board.

The board is mirrored vertically and piece colors are swapped, so that the position is equivalent modulo color.

Alternatively, apply_mirror() can be used to mirror the board.

$copy() \rightarrow BaseBoardT$

Creates a copy of the board.

classmethod empty() \rightarrow BaseBoardT

Creates a new empty board. Also see clear_board().

classmethod from_chess960_pos (scharnagl: int) → BaseBoardT Creates a new board, initialized with a Chess960 starting position.

```
>>> import chess
>>> import random
>>>
>>> board = chess.Board.from_chess960_pos(random.randint(0, 959))
```

8.1.7 Square sets

 ${\tt class} \ {\tt chess.SquareSet} \ (\textit{squares: chess.IntoSquareSet} = 0)$

A set of squares.

```
>>> import chess
>>>
>>> squares = chess.SquareSet([chess.A8, chess.A1])
>>> squares
SquareSet(0x0100_0000_0000_0001)
```

```
>>> squares = chess.SquareSet(chess.BB_A8 | chess.BB_RANK_1)
>>> squares
SquareSet(0x0100_0000_0000_00ff)
```

```
>>> len(squares)
9
```

```
>>> bool(squares)
True
```

```
>>> chess.B1 in squares
True
```

```
>>> for square in squares:
... # 0 -- chess.A1
... # 1 -- chess.B1
... # 2 -- chess.C1
... # 3 -- chess.D1
... # 4 -- chess.E1
... # 5 -- chess.F1
... # 5 -- chess.G1
... # 6 -- chess.A8
... print(square)
```

(continues on next page)

(continued from previous page)

```
0
1
2
3
4
5
6
7
56
```

```
>>> list(squares)
[0, 1, 2, 3, 4, 5, 6, 7, 56]
```

Square sets are internally represented by 64-bit integer masks of the included squares. Bitwise operations can be used to compute unions, intersections and shifts.

```
>>> int(squares)
72057594037928191
```

Also supports common set operations like <code>issubset()</code>, <code>issuperset()</code>, <code>union()</code>, <code>intersection()</code>, <code>difference()</code>, <code>symmetric_difference()</code> and <code>copy()</code> as well as <code>update()</code>, <code>intersection_update()</code>, <code>difference_update()</code>, <code>symmetric_difference_update()</code> and <code>clear()</code>.

add (square: chess.Square) \rightarrow None Adds a square to the set.

discard (*square*: *chess.Square*) \rightarrow None Discards a square from the set.

isdisjoint (*other: chess.IntoSquareSet*) \rightarrow bool Tests if the square sets are disjoint.

issubset (*other*: *chess.IntoSquareSet*) \rightarrow bool Tests if this square set is a subset of another.

issuperset (*other: chess.IntoSquareSet*) \rightarrow bool Tests if this square set is a superset of another.

remove (*square*: *chess.Square*) \rightarrow None Removes a square from the set.

Raises KeyError if the given square was not in the set.

 $pop() \rightarrow chess.Square$

Removes and returns a square from the set.

Raises KeyError if the set is empty.

 $\textbf{clear}\,(\,)\,\to None$

Removes all elements from this set.

 $\textbf{carry_rippler}\,(\,) \, \to Iterator[chess.Bitboard]$

Iterator over the subsets of this set.

 $mirror() \rightarrow chess.SquareSet$

Returns a vertically mirrored copy of this square set.

 $tolist() \rightarrow List[bool]$

Converts the set to a list of 64 bools.

8.1. Core 33

classmethod ray (a: chess. Square, b: chess. Square) \rightarrow chess. Square Set All squares on the rank, file or diagonal with the two squares, if they are aligned.

classmethod between (a: chess.Square, b: chess.Square) \rightarrow chess.SquareSet

All squares on the rank, file or diagonal between the two squares (bounds not included), if they are aligned.

classmethod from_square (square: chess.Square) \rightarrow chess.SquareSet Creates a SquareSet from a single square.

```
>>> import chess
>>>
>>> chess.SquareSet.from_square(chess.A1) == chess.BB_A1
True
```

Common integer masks are:

```
chess.BB_EMPTY: chess.Bitboard = 0
chess.BB_ALL: chess.Bitboard = 0xFFFF_FFFF_FFFF
Single squares:
chess.BB_SQUARES = [chess.BB_A1, chess.BB_B1, ..., chess.BB_G8, chess.BB_H8]
Ranks and files:
chess.BB_RANKS = [chess.BB_RANK_1, ..., chess.BB_RANK_8]
chess.BB_FILES = [chess.BB_FILE_A, ..., chess.BB_FILE_H]
Other masks:
chess.BB_LIGHT_SQUARES: chess.Bitboard = 0x55AA_55AA_55AA_55AA
chess.BB_DARK_SQUARES: chess.Bitboard = 0xAA55_AA55_AA55_AA55
chess.BB_BACKRANKS = chess.BB_RANK_1 | chess.BB_RANK_8
chess.BB_CORNERS = chess.BB_A1 | chess.BB_H1 | chess.BB_A8 | chess.BB_H8
```

```
chess.BB CENTER = chess.BB D4 | chess.BB E4 | chess.BB D5 | chess.BB E5
```

8.2 PGN parsing and writing

8.2.1 Parsing

```
chess.pgn.read_game (handle: TextIO) \rightarrow Optional[chess.pgn.Game] chess.pgn.read_game (handle: TextIO, *, Visitor: Callable[], chess.pgn.BaseVisitor[ResultT]]) \rightarrow Optional[ResultT] Reads a game from a file opened in text mode.
```

By using text mode, the parser does not need to handle encodings. It is the caller's responsibility to open the file with the correct encoding. PGN files are usually ASCII or UTF-8 encoded, sometimes with BOM (which this parser automatically ignores).

```
>>> pgn = open("data/pgn/kasparov-deep-blue-1997.pgn", encoding="utf-8")
```

Use StringIO to parse games from a string.

```
>>> import io
>>>
>>> pgn = io.StringIO("1. e4 e5 2. Nf3 *")
>>> game = chess.pgn.read_game(pgn)
```

The end of a game is determined by a completely blank line or the end of the file. (Of course, blank lines in comments are possible).

According to the PGN standard, at least the usual seven header tags are required for a valid game. This parser also handles games without any headers just fine.

The parser is relatively forgiving when it comes to errors. It skips over tokens it can not parse. By default, any exceptions are logged and collected in <code>Game.errors</code>. This behavior can be <code>overridden</code>.

Returns the parsed game or None if the end of file is reached.

8.2.2 Writing

If you want to export your game with all headers, comments and variations, you can do it like this:

```
>>> import chess
>>> import chess.pgn
>>> game = chess.pgn.Game()
>>> game.headers["Event"] = "Example"
>>> node = game.add_variation(chess.Move.from_uci("e2e4"))
>>> node = node.add_variation(chess.Move.from_uci("e7e5"))
>>> node.comment = "Comment"
>>> print(game)
[Event "Example"]
[Site "?"]
[Date "????.??."]
[Round "?"]
[White "?"]
[Black "?"]
[Result "*"]
1. e4 e5 { Comment } *
```

Remember that games in files should be separated with extra blank lines.

```
>>> print(game, file=open("/dev/null", "w"), end="\n\n")
```

Use the StringExporter() or FileExporter() visitors if you need more control.

8.2.3 Game model

Games are represented as a tree of moves. Each <code>GameNode</code> can have extra information, such as comments. The root node of a game (<code>Game</code> extends the <code>GameNode</code>) also holds general information, such as game headers.

class chess.pgn.**Game** (headers: Optional[Union[Mapping[str, str], Iterable[Tuple[str, str]]]] = None)

The root node of a game with extra information such as headers and the starting position. Also has all the other properties and methods of GameNode.

headers: chess.pgn.Headers

A mapping of headers. By default, the following 7 headers are provided (Seven Tag Roster):

errors: List[Exception]

A list of errors (such as illegal or ambiguous moves) encountered while parsing the game.

```
setup(board: Union[chess.Board, str]) \rightarrow None
```

Sets up a specific starting position. This sets (or resets) the FEN, SetUp, and Variant header tags.

```
accept (visitor: chess.pgn.BaseVisitor[ResultT]) \rightarrow ResultT
```

Traverses the game in PGN order using the given visitor. Returns the visitor result.

classmethod from_board(board: chess.Board) \rightarrow GameT

Creates a game from the move stack of a Board().

$\textbf{classmethod without_tag_roster}\,(\,)\,\rightarrow GameT$

Creates an empty game without the default Seven Tag Roster.

class chess.pgn.GameNode

parent: Optional[chess.pgn.GameNode]

The parent node or None if this is the root node of the game.

variations: List[chess.pgn.GameNode]

A list of child nodes.

move: Optional[chess.Move]

The move leading to this node or None if this is the root node of the game.

nags: Set[int]

A set of NAGs as integers. NAGs always go behind a move, so the root node of the game will never have NAGs.

starting_comment: str

A comment for the start of a variation. Only nodes that actually start a variation (starts_variation() checks this) can have a starting comment. The root node can not have a starting comment.

comment: str

A comment that goes behind the move leading to this node. Comments that occur before any moves are assigned to the root node.

$board() \rightarrow chess.Board$

Gets a board with the position of the node.

For the root node, this is the default starting position (for the Variant) unless the FEN header tag is set.

It's a copy, so modifying the board will not alter the game.

$ply() \rightarrow int$

Returns the number of half-moves up to this node, as indicated by fullmove number and turn of the position. See <code>chess.Board.ply()</code>.

Usually this is equal to the number of parent nodes, but it may be more if the game was started from a custom position.

turn () \rightarrow chess.Color

Gets the color to move at this node. See chess. Board.turn.

\mathtt{san} () \rightarrow str

Gets the standard algebraic notation of the move leading to this node. See chess.Board.san().

Do not call this on the root node.

uci (*, chess960: Optional[bool] = None) \rightarrow str

Gets the UCI notation of the move leading to this node. See chess. Board.uci().

Do not call this on the root node.

game () \rightarrow *Game*

Gets the root node, i.e., the game.

end() \rightarrow chess.pgn.GameNode

Follows the main variation to the end and returns the last node.

```
is end() \rightarrow bool
     Checks if this node is the last node in the current variation.
starts\_variation() \rightarrow bool
     Checks if this node starts a variation (and can thus have a starting comment). The root node does not start
     a variation and can have no starting comment.
     For example, in 1. e4 e5 (1... c5 2. Nf3) 2. Nf3, the node holding 1... c5 starts a varia-
     tion.
is\_mainline() \rightarrow bool
     Checks if the node is in the mainline of the game.
is_main_variation() \rightarrow bool
     Checks if this node is the first variation from the point of view of its parent. The root node is also in the
     main variation.
variation (move: Union[int, chess.Move, chess.pgn.GameNode]) → chess.pgn.GameNode
     Gets a child node by either the move or the variation index.
has variation (move: Union[int, chess.Move, chess.pgn.GameNode]) → bool
     Checks if this node has the given variation.
promote_to_main (move: Union[int, chess.Move, chess.pgn.GameNode]) → None
     Promotes the given move to the main variation.
promote (move: Union[int, chess.Move, chess.pgn.GameNode]) \rightarrow None
     Moves a variation one up in the list of variations.
demote (move: Union[int, chess.Move, chess.pgn.GameNode]) → None
     Moves a variation one down in the list of variations.
remove_variation (move: Union[int, chess.Move, chess.pgn.GameNode]) → None
     Removes a variation.
add_variation(move: chess.Move, *, comment: str = ", starting_comment: str = ", nags: Iter-
                    able[int] = []) \rightarrow chess.pgn.GameNode
     Creates a child node with the given attributes.
add_main_variation (move: chess.Move, *, comment: str = ") \rightarrow chess.pgn.GameNode
     Creates a child node with the given attributes and promotes it to the main variation.
mainline() \rightarrow chess.pgn.Mainline[chess.pgn.GameNode]
     Returns an iterable over the mainline starting after this node.
mainline\_moves() \rightarrow chess.pgn.Mainline[chess.Move]
     Returns an iterable over the main moves after this node.
add_line (moves: Iterable[chess.Move], *, comment: str = ", starting_comment: str = ", nags: Iterable
             able[int] = []) \rightarrow chess.pgn.GameNode
     Creates a sequence of child nodes for the given list of moves. Adds comment and nags to the last node of
     the line and returns it.
eval() \rightarrow Optional[chess.engine.PovScore]
     Parses the first valid [%eval ...] annotation in the comment of this node, if any.
```

Replaces the first valid [%eval ...] annotation in the comment of this node or adds a new one.

Parses all [%csl ...] and [%cal ...] annotations in the comment of this node.

 $\mathtt{set_eval}$ (score: Optional[chess.engine.PovScore]) \rightarrow None

 $arrows() \rightarrow List[chess.svg.Arrow]$

Returns a list of arrows.

```
set\_arrows (arrows: Iterable[Union[chess.svg.Arrow, Tuple[chess.Square, chess.Square]]]) \rightarrow None
```

None Replaces all valid [%csl ...] and [%cal ...] annotations in the comment of this node or adds new ones.

```
clock() \rightarrow Optional[float]
```

Parses the first valid [%clk ...] annotation in the comment of this node, if any.

Returns the player's remaining time to the next time control after this move, in seconds.

```
set\_clock (seconds: Optional[float]) \rightarrow None
```

Replaces the first valid [%clk ...] annotation in the comment of this node or adds a new one.

```
accept (visitor: chess.pgn.BaseVisitor[ResultT]) \rightarrow ResultT
```

Traverses game nodes in PGN order using the given *visitor*. Starts with the move leading to this node. Returns the *visitor* result.

```
accept\_subgame (visitor: chess.pgn.BaseVisitor[ResultT]) \rightarrow ResultT
```

Traverses headers and game nodes in PGN order, as if the game was starting after this node. Returns the *visitor* result.

8.2.4 Visitors

Visitors are an advanced concept for game tree traversal.

```
class chess.pgn.BaseVisitor(*args, **kwds)
```

Base class for visitors.

Use with chess.pgn.Game.accept() or chess.pgn.GameNode.accept() or chess.pgn.read_game().

The methods are called in PGN order.

begin_game() \rightarrow Optional[chess.pgn.SkipType]

Called at the start of a game.

 $begin_headers() \rightarrow Optional[chess.pgn.Headers]$

Called before visiting game headers.

 $visit_header(tagname: str, tagvalue: str) \rightarrow None$

Called for each game header.

end_headers() → Optional[chess.pgn.SkipType]

Called after visiting game headers.

```
parse_san (board: chess.Board, san: str) \rightarrow chess.Move
```

When the visitor is used by a parser, this is called to parse a move in standard algebraic notation.

You can override the default implementation to work around specific quirks of your input format.

Deprecated since version 1.1: This method is very limited, because it is only called on moves that the parser recognizes in the first place. Instead of adding workarounds here, please report common quirks so that they can be handled for everyone.

```
visit_move(board: chess.Board, move: chess.Move) \rightarrow None
```

Called for each move.

board is the board state before the move. The board state must be restored before the traversal continues.

```
visit\_board(board: chess.Board) \rightarrow None
```

Called for the starting position of the game and after each move.

The board state must be restored before the traversal continues.

visit_comment (comment: str) \rightarrow None Called for each comment.

```
visit_nag(nag:int) \rightarrow None
          Called for each NAG.
     begin_variation() → Optional[chess.pgn.SkipType]
          Called at the start of a new variation. It is not called for the mainline of the game.
     end variation() \rightarrow None
          Concludes a variation.
     visit result (result: str) \rightarrow None
          Called at the end of a game with the value from the Result header.
     end_game() \rightarrow None
          Called at the end of a game.
     abstract result() → ResultT
          Called to get the result of the visitor.
     handle error (error: Exception) \rightarrow None
          Called for encountered errors. Defaults to raising an exception.
The following visitors are readily available.
class chess.pgn.GameBuilder(*args, **kwds)
     Creates a game model. Default visitor for read game ().
     handle\_error(error: Exception) \rightarrow None
          Populates chess.pgn.Game.errors with encountered errors and logs them.
          You can silence the log and handle errors yourself after parsing:
          >>> import chess.pgn
          >>> import logging
          >>>
          >>> logging.getLogger("chess.pgn").setLevel(logging.CRITICAL)
          >>>
          >>> pgn = open("data/pgn/kasparov-deep-blue-1997.pgn")
          >>>
          >>> game = chess.pgn.read_game(pgn)
          >>> game.errors # List of exceptions
          []
          You can also override this method to hook into error handling:
          >>> import chess.pgn
          >>> class MyGameBuilder (chess.pgn.GameBuilder):
                def handle_error(self, error: Exception) -> None:
          >>>
                        pass # Ignore error
          >>>
          >>>
```

```
result() \rightarrow GameT
```

Returns the visited Game ().

```
class chess.pgn.HeadersBuilder(*args, **kwds)
```

>>> pgn = open("data/pgn/kasparov-deep-blue-1997.pgn")

>>> game = chess.pgn.read_game(pgn, Visitor=MyGameBuilder)

Collects headers into a dictionary.

```
class chess.pqn.BoardBuilder(*args, **kwds)
```

Returns the final position of the game. The mainline of the game is on the move stack.

```
class chess.pgn.SkipVisitor(*args, **kwds)
    Skips a game.
```

```
class chess.pgn.StringExporter(*args, **kwds)
```

Allows exporting a game as a string.

Only *columns* characters are written per line. If *columns* is None, then the entire movetext will be on a single line. This does not affect header tags and comments.

There will be no newline characters at the end of the string.

```
class chess.pgn.FileExporter(*args, **kwds)
```

Acts like a *StringExporter*, but games are written directly into a text file.

There will always be a blank line after each game. Handling encodings is up to the caller.

```
>>> import chess.pgn
>>>
>>> game = chess.pgn.Game()
>>>
>>> new_pgn = open("/dev/null", "w", encoding="utf-8")
>>> exporter = chess.pgn.FileExporter(new_pgn)
>>> game.accept(exporter)
```

8.2.5 NAGs

Numeric anotation glyphs describe moves and positions using standardized codes that are understood by many chess programs. During PGN parsing, annotations like !, ?, !!, etc., are also converted to NAGs.

```
chess.pgn.NAG_GOOD_MOVE = 1
```

A good move. Can also be indicated by ! in PGN notation.

```
chess.pqn.NAG_MISTAKE = 2
```

A mistake. Can also be indicated by ? in PGN notation.

```
chess.pgn.NAG_BRILLIANT_MOVE = 3
```

A brilliant move. Can also be indicated by !! in PGN notation.

```
chess.pgn.NAG_BLUNDER = 4
```

A blunder. Can also be indicated by ?? in PGN notation.

```
chess.pgn.NAG_SPECULATIVE_MOVE = 5
```

A speculative move. Can also be indicated by !? in PGN notation.

```
chess.pgn.NAG_DUBIOUS_MOVE = 6
```

A dubious move. Can also be indicated by ?! in PGN notation.

8.2.6 Skimming

These functions allow for quickly skimming games without fully parsing them.

```
chess.pgn.read_headers (handle: TextIO) → Optional[chess.pgn.Headers]
Reads game headers from a PGN file opened in text mode.
```

Since actually parsing many games from a big file is relatively expensive, this is a better way to look only for specific games and then seek and parse them later.

This example scans for the first game with Kasparov as the white player.

```
>>> import chess.pgn
>>> pgn = open("data/pgn/kasparov-deep-blue-1997.pgn")
>>>
>>> kasparov_offsets = []
>>> while True:
       offset = pgn.tell()
. . .
        headers = chess.pgn.read_headers(pgn)
        if headers is None:
. . .
            break
. . .
. . .
        if "Kasparov" in headers.get("White", "?"):
. . .
            kasparov_offsets.append(offset)
```

Then it can later be seeked and parsed.

chess.pgn.skip_game(handle: TextIO) $\rightarrow bool$

Skips a game. Returns True if a game was found and skipped.

8.3 Polyglot opening book reading

```
chess.polyglot.open_reader(path: Union[str, bytes, os.PathLike]) → 
chess.polyglot.MemoryMappedReader
```

Creates a reader for the file at the given path.

The following example opens a book to find all entries for the start position:

```
>>> import chess
>>> import chess.polyglot
>>>
>>> board = chess.Board()
>>>
>>> with chess.polyglot.open_reader("data/polyglot/performance.bin") as reader:
```

(continues on next page)

(continued from previous page)

class chess.polyglot.**Entry** (*key: int, raw_move: int, weight: int, learn: int, move:* chess.Move) An entry from a Polyglot opening book.

key: int

The Zobrist hash of the position.

raw_move: int

The raw binary representation of the move. Use move instead.

weight: int

An integer value that can be used as the weight for this entry.

learn: int

Another integer value that can be used for extra information.

move: chess.Move

The Move.

find_all (board: Union[chess.Board, int], *, minimum_weight: int = 1, exclude_moves: Container[chess.Move] = []) → Iterator[chess.polyglot.Entry] Seeks a specific position and yields corresponding entries.

find (board: Union[chess.Board, int], *, minimum_weight: int = 1, exclude_moves: Container[chess.Move] = []) \to chess.polyglot.Entry
Finds the main entry for the given position or Zobrist hash.

The main entry is the (first) entry with the highest weight.

By default, entries with weight 0 are excluded. This is a common way to delete entries from an opening book without compacting it. Pass $minimum_weight 0$ to select all entries.

Raises IndexError if no entries are found. Use get () if you prefer to get None instead of an exception.

choice (board: Union[chess.Board, int], *, minimum_weight: int = 1, exclude_moves: Container[chess.Move] = [], random: Optional[random.Random] = None) \rightarrow chess.polyglot.Entry

Uniformly selects a random entry for the given position.

Raises IndexError if no entries are found.

weighted_choice (board: Union[chess.Board, int], *, exclude_moves: Container[chess.Move] = [], random: Optional[random.Random] = None) \rightarrow chess.polyglot.Entry Selects a random entry for the given position, distributed by the weights of the entries.

Raises IndexError if no entries are found.

 $close() \rightarrow None$

Closes the reader.

chess.polyglot.POLYGLOT_RANDOM_ARRAY = [0x9D39247E33776D41, ..., 0xF8D626AAAF278509]
Array of 781 polyglot compatible pseudo random values for Zobrist hashing.

```
chess.polyglot.zobrist_hash (board: chess.Board, *, _hasher: Callable[[chess.Board], int] = <chess.polyglot.ZobristHasher object>) \rightarrow int Calculates the Polyglot Zobrist hash of the position.
```

A Zobrist hash is an XOR of pseudo-random values picked from an array. Which values are picked is decided by features of the position, such as piece positions, castling rights and en passant squares.

8.4 Gaviota endgame tablebase probing

Gaviota tablebases provide **WDL** (win/draw/loss) and **DTM** (depth to mate) information for all endgame positions with up to 5 pieces. Positions with castling rights are not included.

Warning: Ensure tablebase files match the known checksums. Maliciously crafted tablebase files may cause denial of service with <code>PythonTablebase</code> and memory unsafety with <code>NativeTablebase</code>.

```
chess.gaviota.open_tablebase(directory: str, *, libgtb: Optional[str] = None, LibraryLoader: ctypes.LibraryLoader[ctypes.CDLL] = \langle ctypes.LibraryLoader object \rangle) \rightarrow Union[NativeTablebase, PythonTablebase]
```

Opens a collection of tables for probing.

First native access via the shared library libgth is tried. You can optionally provide a specific library name or a library loader. The shared library has global state and caches, so only one instance can be open at a time.

Second, pure Python probing code is tried.

```
class chess.gaviota.PythonTablebase
```

Provides access to Gaviota tablebases using pure Python code.

```
add\_directory(directory: str) \rightarrow None
```

Adds .gtb.cp4 tables from a directory. The relevant files are lazily opened when the tablebase is actually probed.

```
probe_dtm(board: chess.Board) \rightarrow int
```

Probes for depth to mate information.

The absolute value is the number of half-moves until forced mate (or 0 in drawn positions). The value is positive if the side to move is winning, otherwise it is negative.

In the example position, white to move will get mated in 10 half-moves:

```
>>> import chess
>>> import chess.gaviota
>>>
    with chess.gaviota.open_tablebase("data/gaviota") as tablebase:
...    board = chess.Board("8/8/8/8/8/8/8/K2kr3 w - - 0 1")
...    print(tablebase.probe_dtm(board))
...
-10
```

Raises KeyError (or specifically chess.gaviota.MissingTableError) if the probe fails. Use get dtm() if you prefer to get None instead of an exception.

Note that probing a corrupted table file is undefined behavior.

```
probe_wdl (board: chess.Board) \rightarrow int
```

Probes for win/draw/loss information.

Returns 1 if the side to move is winning, 0 if it is a draw, and -1 if the side to move is losing.

```
>>> import chess
>>> import chess.gaviota
>>>
    with chess.gaviota.open_tablebase("data/gaviota") as tablebase:
        board = chess.Board("8/4k3/8/B7/8/8/8/4K3 w - - 0 1")
        print(tablebase.probe_wdl(board))
...
0
```

Raises KeyError (or specifically chess.gaviota.MissingTableError) if the probe fails. Use get_wdl() if you prefer to get None instead of an exception.

Note that probing a corrupted table file is undefined behavior.

```
close() \rightarrow None Closes all loaded tables.
```

8.4.1 libgtb

For faster access you can build and install a shared library. Otherwise the pure Python probing code is used.

```
git clone https://github.com/michiguel/Gaviota-Tablebases.git cd Gaviota-Tablebases make sudo make install
```

In most cases <code>open_tablebase()</code> should be used. Use this function only if you do not want to downgrade to pure Python tablebase probing.

Raises RuntimeError or OSError when libgtb can not be used.

```
class chess.gaviota.NativeTablebase (libgtb: ctypes.CDLL)

Provides access to Gaviota tablebases via the shared library libgtb. Has the same interface as 
PythonTablebase.
```

8.5 Syzygy endgame tablebase probing

Syzygy tablebases provide **WDL** (win/draw/loss) and **DTZ** (distance to zero) information for all endgame positions with up to 7 pieces. Positions with castling rights are not included.

Warning: Ensure tablebase files match the known checksums. Maliciously crafted tablebase files may cause denial of service.

```
chess.syzygy.open_tablebase (directory: str, *, load\_wdl: bool = True, load\_dtz: bool = True, max\_fds: Optional[int] = 128, VariantBoard: Type[chess.Board] = \\ < class 'chess.Board'>) \rightarrow chess.syzygy.Tablebase
Opens a collection of tables for probing. See Tablebase.
```

Note: Generally probing requires tablebase files for the specific material composition, **as well as** material compositions transitively reachable by captures and promotions. This is important because 6-piece and 5-piece (let alone 7-piece) files are often distributed separately, but are both required for 6-piece positions. Use add_directory() to load tables from additional directories.

If $max_f ds$ is not None, will at most use $max_f ds$ open file descriptors at any given time. The least recently used tables are closed, if nescessary.

```
add_directory (directory: str, *, load_wdl: bool = True, load_dtz: bool = True) \rightarrow int Adds tables from a directory.
```

By default all available tables with the correct file names (e.g. WDL files like KQvKN.rtbw and DTZ files like KRBvK.rtbz) are added.

The relevant files are lazily opened when the tablebase is actually probed.

Returns the number of table files that were found.

```
probe_wdl (board: chess.Board) \rightarrow int
```

Probes WDL tables for win/draw/loss-information.

Probing is thread-safe when done with different *board* objects and if *board* objects are not modified during probing.

Returns 2 if the side to move is winning, 0 if the position is a draw and -2 if the side to move is losing.

Returns 1 in case of a cursed win and -1 in case of a blessed loss. Mate can be forced but the position can be drawn due to the fifty-move rule.

```
>>> import chess
>>> import chess.syzygy
>>>
with chess.syzygy.open_tablebase("data/syzygy/regular") as tablebase:
... board = chess.Board("8/2K5/4B3/3N4/8/4k3/8 b - - 0 1")
... print(tablebase.probe_wdl(board))
...
-2
```

Raises KeyError (or specifically chess.syzygy.MissingTableError) if the position could not be found in the tablebase. Use get_wdl() if you prefer to get None instead of an exception.

Note that probing corrupted table files is undefined behavior.

```
probe_dtz (board: chess.Board) \rightarrow int
```

Probes DTZ tables for distance to zero information.

Both DTZ and WDL tables are required in order to probe for DTZ.

Returns a positive value if the side to move is winning, 0 if the position is a draw and a negative value if the side to move is losing. More precisely:

WDL	DTZ	
-2	-100 <=	Unconditional loss (assuming 50-move counter is zero), where a zeroing move can
	n <= -1	be forced in -n plies.
-1	n < -100	Loss, but draw under the 50-move rule. A zeroing move can be forced in -n plies or
		-n - 100 plies (if a later phase is responsible for the blessed loss).
0	0	Draw.
1	100 < n	Win, but draw under the 50-move rule. A zeroing move can be forced in n plies or n
		- 100 plies (if a later phase is responsible for the cursed win).
2	1 <= n	Unconditional win (assuming 50-move counter is zero), where a zeroing move can
	<= 100	be forced in n plies.

The return value can be off by one: a return value -n can mean a losing zeroing move in in n + 1 plies and a return value +n can mean a winning zeroing move in n + 1 plies. This is guaranteed not to happen for positions exactly on the edge of the 50-move rule, so that (with some care) this never impacts the result of practical play.

Minmaxing the DTZ values guarantees winning a won position (and drawing a drawn position), because it makes progress keeping the win in hand. However the lines are not always the most straightforward ways to win. Engines like Stockfish calculate themselves, checking with DTZ, but only play according to DTZ if they can not manage on their own.

```
>>> import chess
>>> import chess.syzygy
>>>
with chess.syzygy.open_tablebase("data/syzygy/regular") as tablebase:
... board = chess.Board("8/2K5/4B3/3N4/8/4k3/8 b - - 0 1")
... print(tablebase.probe_dtz(board))
...
-53
```

Probing is thread-safe when done with different *board* objects and if *board* objects are not modified during probing.

Raises KeyError (or specifically chess.syzygy.MissingTableError) if the position could not be found in the tablebase. Use get_dtz() if you prefer to get None instead of an exception.

Note that probing corrupted table files is undefined behavior.

```
close() \rightarrow None Closes all loaded tables.
```

8.6 UCI/XBoard engine communication

UCI and XBoard are protocols for communicating with chess engines. This module implements an abstraction for playing moves and analysing positions with both kinds of engines.

Warning: Many popular chess engines make no guarantees, not even memory safety, when parameters and positions are not completely *valid*. This module tries to deal with benign misbehaving engines, but ultimately they are executables running on your system.

The preferred way to use the API is with an asyncio event loop. The examples also show a synchronous wrapper <code>SimpleEngine</code> that automatically spawns an event loop in the background.

8.6.1 Playing

Example: Let Stockfish play against itself, 100 milliseconds per move.

```
import chess
import chess.engine
engine = chess.engine.SimpleEngine.popen_uci("/usr/bin/stockfish")

board = chess.Board()
while not board.is_game_over():
    result = engine.play(board, chess.engine.Limit(time=0.1))
    board.push(result.move)
engine.quit()
```

```
import asyncio
import chess
import chess.engine

async def main() -> None:
    transport, engine = await chess.engine.popen_uci("/usr/bin/stockfish")

board = chess.Board()
    while not board.is_game_over():
        result = await engine.play(board, chess.engine.Limit(time=0.1))
        board.push(result.move)

await engine.quit()

asyncio.set_event_loop_policy(chess.engine.EventLoopPolicy())
asyncio.run(main())
```

class chess.engine.Protocol

Protocol for communicating with a chess engine process.

abstract async play (board: chess.Board, limit: chess.engine.Limit, *, game: Optional[object] = None, info: chess.engine.Info = $\langle Info.NONE: 0 \rangle$, ponder: bool = False, root_moves: Optional[Iterable[chess.Move]] = None, options: Mapping[str, Optional[Union[str, int, bool]]] = {}) \rightarrow chess.engine.PlayResult

Plays a position.

Parameters

- board The position. The entire move stack will be sent to the engine.
- limit An instance of chess.engine.Limit that determines when to stop thinking.
- game Optional. An arbitrary object that identifies the game. Will automatically inform the engine if the object is not equal to the previous game (e.g., ucinewgame, new).
- info Selects which additional information to retrieve from the engine. INFO_NONE, INFO_BASE (basic information that is trivial to obtain), INFO_SCORE, INFO_PV, INFO_REFUTATION, INFO_CURRLINE, INFO_ALL or any bitwise combination. Some overhead is associated with parsing extra information.
- **ponder** Whether the engine should keep analysing in the background even after the result has been returned.
- root_moves Optional. Consider only root moves from this list.

• **options** – Optional. A dictionary of engine options for the analysis. The previous configuration will be restored after the analysis is complete. You can permanently apply a configuration with *configure()*.

Search-termination condition.

time: Optional[float] = None
 Search exactly time seconds.

depth: Optional[int] = None
 Search depth ply only.

nodes: Optional[int] = None
 Search only a limited number of nodes.

mate: Optional[int] = None
 Search for a mate in mate moves.

white_clock: Optional[float] = None
 Time in seconds remaining for White.

black_clock: Optional[float] = None
 Time in seconds remaining for Black.

white_inc: Optional[float] = None
 Fisher increment for White, in seconds.

black_inc: Optional[float] = None
 Fisher increment for Black, in seconds.

remaining_moves: Optional[int] = None

Number of moves to the next time control. If this is not set, but white_clock and black_clock are, then it is sudden death.

Returned by chess.engine.Protocol.play().

move: Optional[chess.Move]

The best move according to the engine, or None.

ponder: Optional[chess.Move]

The response that the engine expects after move, or None.

info: chess.engine.InfoDict

A dictionary of extra information sent by the engine.

draw_offered: bool

Whether the engine offered a draw before moving.

resigned: bool

Whether the engine resigned.

8.6.2 Analysing and evaluating a position

Example:

```
import asyncio
import chess
import chess.engine
async def main() -> None:
   transport, engine = await chess.engine.popen_uci("/usr/bin/stockfish")
   board = chess.Board()
   info = await engine.analyse(board, chess.engine.Limit(time=0.1))
   print(info["score"])
    # Score: +20
   board = chess.Board("r1bqkbnr/p1pp1ppp/1pn5/4p3/2B1P3/5Q2/PPPP1PPP/RNB1K1NR w,...
→KQkq - 2 4")
   info = await engine.analyse(board, chess.engine.Limit(depth=20))
   print(info["score"])
    # Score: #+1
   await engine.quit()
asyncio.set_event_loop_policy(chess.engine.EventLoopPolicy())
asyncio.run(main())
```

class chess.engine.Protocol

Protocol for communicating with a chess engine process.

```
async analyse (board: chess.Board, limit: chess.engine.Limit, *, game: object = 'None', info: chess.engine.Info = 'INFO_ALL', root_moves: Optional[Iterable[chess.Move]]
= 'None', options: Mapping[str, Optional[Union[str, int, bool]]] = '{}') → chess.engine.InfoDict

async analyse (board: chess.Board, limit: chess.engine.Limit, *, multipv: int, game: object = 'None', info: chess.engine.Info = 'INFO_ALL', root_moves: Optional[Iterable[chess.Move]]
= 'None', options: Mapping[str, Optional[Union[str, int, bool]]] = '{}') → List[chess.engine.InfoDict]
```

async analyse (board: chess.Board, limit: chess.engine.Limit, *, multipv: Optional[int] = 'None', game: object = 'None', info: chess.engine.Info = 'INFO_ALL', root_moves: Optional[Iterable[chess.Move]] = 'None', options: Mapping[str, Optional[Union[str, int, bool]]] = '{}') → Union[List[chess.engine.InfoDict], chess.engine.InfoDict]
Analyses a position and returns a dictionary of information.

Parameters

- board The position to analyse. The entire move stack will be sent to the engine.
- limit An instance of chess.engine.Limit that determines when to stop the analysis.
- multipv Optional. Analyse multiple root moves. Will return a list of at most *multipv* dictionaries rather than just a single info dictionary.
- game Optional. An arbitrary object that identifies the game. Will automatically inform the engine if the object is not equal to the previous game (e.g., ucinewgame, new).
- info Selects which information to retrieve from the engine. INFO_NONE, INFO_BASE (basic information that is trivial to obtain), INFO_SCORE, INFO_PV, INFO_REFUTATION, INFO_CURRLINE, INFO_ALL or any bitwise combination. Some overhead is associated with parsing extra information.
- root_moves Optional. Limit analysis to a list of root moves.
- **options** Optional. A dictionary of engine options for the analysis. The previous configuration will be restored after the analysis is complete. You can permanently apply a configuration with *configure()*.

```
class chess.engine.InfoDict(*args, **kwargs)
```

Dictionary of aggregated information sent by the engine.

Commonly used keys are: score (a *PovScore*), pv (a list of *Move* objects), depth, seldepth, time (in seconds), nodes, nps, multipv (1 for the mainline).

Others: tbhits, currmove, currmovenumber, hashfull, cpuload, refutation, currline, ebf, wdl (a PovWdl), and string.

class chess.engine.**PovScore** (*relative*: chess.engine.Score, *turn*: *chess.Color*)

A relative *Score* and the point of view.

```
relative: chess.engine.Score
```

The relative Score.

turn: chess.Color

The point of view (chess.WHITE or chess.BLACK).

white () \rightarrow chess.engine.Score

Gets the score from White's point of view.

$black() \rightarrow chess.engine.Score$

Gets the score from Black's point of view.

 $pov(color: chess.Color) \rightarrow chess.engine.Score$

Gets the score from the point of view of the given *color*.

is mate() \rightarrow bool

Tests if this is a mate score.

wdl (*, model: Literal[sf12] = 'sf12', ply: int = 30) \rightarrow chess.engine.PovWdl See wdl ().

```
class chess.engine.Score
```

Evaluation of a position.

The score can be Cp (centi-pawns), Mate or MateGiven. A positive value indicates an advantage.

There is a total order defined on centi-pawn and mate scores.

```
>>> from chess.engine import Cp, Mate, MateGiven
>>>
>>> Mate(-0) < Mate(-1) < Cp(-50) < Cp(200) < Mate(4) < Mate(1) < MateGiven
True</pre>
```

Scores can be negated to change the point of view:

```
>>> -Cp(20)
Cp(-20)
```

```
>>> -Mate(-4)
Mate(+4)
```

```
>>> -Mate(0)
MateGiven
```

```
\begin{tabular}{ll} \textbf{abstract} & \textbf{score} \ (*, mate\_score: int) \ \rightarrow \ int \\ \textbf{abstract} & \textbf{score} \ (*, mate\_score: Optional[int] = 'None') \ \rightarrow \ Optional[int] \\ \end{tabular}
```

Returns the centi-pawn score as an integer or None.

You can optionally pass a large value to convert mate scores to centi-pawn scores.

```
>>> Cp(-300).score()
-300
>>> Mate(5).score() is None
True
>>> Mate(5).score(mate_score=100000)
99995
```

abstract mate() → Optional[int]

Returns the number of plies to mate, negative if we are getting mated, or None.

```
Warning: This conflates Mate(0) (we lost) and MateGiven (we won) to 0.
```

```
is\_mate() \rightarrow bool
```

Tests if this is a mate score.

```
abstract wdl (*, model: Literal[sf12] = 'sf12', ply: int = 30) \rightarrow chess.engine.Wdl
```

Returns statistics for the expected outcome of this game, based on a *model*, given that this score is reached at *ply*.

Scores have a total order, but it makes little sense to compute the difference between two scores. For example, going from Cp(-100) to Cp(+100) is much more significant than going from Cp(+300) to Cp(+500). It is better to compute differences of the expectation values for the outcome of the game (based on winning chances and drawing chances).

```
>>> Cp(100).wdl().expectation() - Cp(-100).wdl().expectation() 0.379...
```

```
>>> Cp(500).wdl().expectation() - Cp(300).wdl().expectation() 0.015...
```

Parameters

- model Currently, the only implemented model is sf12, the win rate model used by Stockfish 12.
- ply The number of half-moves played since the starting position. Models may scale scores slightly differently based on this. Defaults to middle game.

```
class chess.engine.PovWdl (relative: chess.engine.Wdl, turn: chess.Color)

Relative win/draw/loss statistics and the point of view.
```

Deprecated since version 1.2: Behaves like a tuple (wdl.relative.wins, wdl.relative.draws, wdl.relative.losses) for backwards compatibility. But it is recommended to use the provided fields and methods instead

```
and methods instead.
      relative:
                      chess.engine.Wdl
           The relative Wd1.
      turn: chess.Color
           The point of view (chess.WHITE or chess.BLACK).
      white () \rightarrow chess.engine.Wdl
           Gets the Wdl from White's point of view.
      black() \rightarrow chess.engine.Wdl
           Gets the Wdl from Black's point of view.
      pov(color: chess.Color) \rightarrow chess.engine.Wdl
           Gets the Wdl from the point of view of the given color.
class chess.engine. Wdl (wins: int, draws: int, losses: int)
      Win/draw/loss statistics.
      wins:
               int
           The number of wins.
      draws: int
           The number of draws.
      losses: int
           The number of losses.
      total() \rightarrow int
           Returns the total number of games. Usually wdl reported by engines is scaled to 1000 games.
      \textbf{winning\_chance} \ () \ \rightarrow float
           Returns the relative frequency of wins.
      drawing chance () \rightarrow float
           Returns the relative frequency of draws.
      losing\_chance() \rightarrow float
           Returns the relative frequency of losses.
      expectation() \rightarrow float
           Returns the expectation value, where a win is valued 1, a draw is valued 0.5, and a loss is valued 0.
```

8.6.3 Indefinite or infinite analysis

Example: Stream information from the engine and stop on an arbitrary condition.

```
import chess
import chess.engine
engine = chess.engine.SimpleEngine.popen_uci("/usr/bin/stockfish")

with engine.analysis(chess.Board()) as analysis:
    for info in analysis:
        print(info.get("score"), info.get("pv"))

# Arbitrary stop condition.
    if info.get("seldepth", 0) > 20:
        break

engine.quit()
```

```
import asyncio
import chess
import chess.engine

async def main() -> None:
    transport, engine = await chess.engine.popen_uci("/usr/bin/stockfish")

with await engine.analysis(chess.Board()) as analysis:
    async for info in analysis:
    print(info.get("score"), info.get("pv"))

# Arbitrary stop condition.
    if info.get("seldepth", 0) > 20:
        break

await engine.quit()

asyncio.set_event_loop_policy(chess.engine.EventLoopPolicy())
asyncio.run(main())
```

class chess.engine.Protocol

Protocol for communicating with a chess engine process.

```
abstract async analysis (board: chess.Board, limit: Optional[chess.engine.Limit] = None, *, multipv: Optional[int] = None, game: Optional[object] = None, info: chess.engine.Info = <Info.ALL: 31>, root_moves: Optional[Iterable[chess.Move]] = None, options: Mapping[str, Optional[Union[str, int, bool]]] = {}) \rightarrow chess.engine.AnalysisResult
```

Starts analysing a position.

Parameters

- board The position to analyse. The entire move stack will be sent to the engine.
- limit Optional. An instance of *chess.engine.Limit* that determines when to stop the analysis. Analysis is infinite by default.
- multipv Optional. Analyse multiple root moves.
- game Optional. An arbitrary object that identifies the game. Will automatically inform the engine if the object is not equal to the previous game (e.g., ucinewgame, new).

- info Selects which information to retrieve from the engine. INFO_NONE, INFO_BASE (basic information that is trivial to obtain), INFO_SCORE, INFO_PV, INFO_REFUTATION, INFO_CURRLINE, INFO_ALL or any bitwise combination. Some overhead is associated with parsing extra information.
- root_moves Optional. Limit analysis to a list of root moves.
- **options** Optional. A dictionary of engine options for the analysis. The previous configuration will be restored after the analysis is complete. You can permanently apply a configuration with *configure()*.

Returns AnalysisResult, a handle that allows asynchronously iterating over the information sent by the engine and stopping the analysis at any time.

```
class chess.engine.AnalysisResult(stop: Optional[Callable[], None]] = None)
```

Handle to ongoing engine analysis. Returned by chess.engine.Protocol.analysis().

Can be used to asynchronously iterate over information sent by the engine.

Automatically stops the analysis when used as a context manager.

```
multipv: List[chess.engine.InfoDict]
```

A list of dictionaries with aggregated information sent by the engine. One item for each root move.

property info

A dictionary of aggregated information sent by the engine. This is actually an alias for multipv[0].

```
stop() \rightarrow None
```

Stops the analysis as soon as possible.

```
async wait () \rightarrow chess.engine.BestMove
```

Waits until the analysis is complete (or stopped).

```
async get() \rightarrow chess.engine.InfoDict
```

Waits for the next dictionary of information from the engine and returns it.

It might be more convenient to use async for info in analysis:

Raises chess.engine.AnalysisComplete if the analysis is complete (or has been stopped) and all information has been consumed. Use next() if you prefer to get None instead of an exception.

```
\textbf{empty}\,(\,)\,\rightarrow bool
```

Checks if all information has been consumed.

If the queue is empty, but the analysis is still ongoing, then further information can become available in the future.

If the queue is not empty, then the next call to get () will return instantly.

```
class chess.engine.BestMove(move: Optional[chess.Move], ponder: Optional[chess.Move])
    Returned by chess.engine.AnalysisResult.wait().
```

```
move: Optional[chess.Move]
```

The best move according to the engine, or None.

```
ponder: Optional[chess.Move]
```

The response that the engine expects after *move*, or None.

8.6.4 Options

configure (), play (), analyse () and analysis () accept a dictionary of options.

```
>>> import chess.engine
>>> engine = chess.engine.SimpleEngine.popen_uci("/usr/bin/stockfish")
>>>
>>> # Check available options.
>>> engine.options["Hash"]
Option(name='Hash', type='spin', default=16, min=1, max=131072, var=[])
>>> # Set an option.
>>> engine.configure({"Hash": 32})
>>> # [...]
```

```
import asyncio
import chess.engine

async def main() -> None:
    transport, protocol = await chess.engine.popen_uci("/usr/bin/stockfish")

# Check available options.
    print(engine.options["Hash"])
    # Option(name='Hash', type='spin', default=16, min=1, max=131072, var=[])

# Set an option.
    await engine.configure({"Hash": 32})

# [...]

asyncio.set_event_loop_policy(chess.engine.EventLoopPolicy())
asyncio.run(main())
```

class chess.engine.Protocol

Protocol for communicating with a chess engine process.

```
options: MutableMapping[str, Option]
```

Dictionary of available options.

abstract async configure (options: $Mapping[str, Optional[Union[str, int, bool]]]) \rightarrow None Configures global engine options.$

Parameters options — A dictionary of engine options where the keys are names of options. Do not set options that are managed automatically (chess.engine. Option.is_managed()).

name: str

The name of the option.

type: str

The type of the option.

type	UCI	CECP	value
check	X	X	True or False
button	X	X	None
reset		X	None
save		X	None
string	X	X	string without line breaks
file		X	string, interpreted as the path to a file
path		X	string, interpreted as the path to a directory

default: Optional[Union[str, int, bool]]

The default value of the option.

min: Optional[int]

The minimum integer value of a *spin* option.

max: Optional[int]

The maximum integer value of a *spin* option.

var: Optional[List[str]]

A list of allowed string values for a *combo* option.

 $is_{managed}() \rightarrow bool$

Some options are managed automatically: UCI_Chess960, UCI_Variant, MultiPV, Ponder.

8.6.5 Logging

Communication is logged with debug level on a logger named chess.engine. Debug logs are useful while troubleshooting. Please also provide them when submitting bug reports.

```
import logging

# Enable debug logging.
logging.basicConfig(level=logging.DEBUG)
```

8.6.6 AsyncSSH

chess.engine.Protocol can also be used with AsyncSSH (since 1.16.0) to communicate with an engine on a remote computer.

8.6.7 Reference

```
class chess.engine.EngineError
```

Runtime error caused by a misbehaving engine or incorrect usage.

```
class chess.engine.EngineTerminatedError
```

The engine process exited unexpectedly.

```
class chess.engine.AnalysisComplete
```

Raised when analysis is complete, all information has been consumed, but further information was requested.

Spawns and initializes a UCI engine.

Parameters

- **command** Path of the engine executable, or a list including the path and arguments.
- **setpgrp** Open the engine process in a new process group. This will stop signals (such as keyboard interrupts) from propagating from the parent process. Defaults to False.
- popen_args Additional arguments for popen. Do not set stdin, stdout, bufsize or universal_newlines.

Returns a subprocess transport and engine protocol pair.

```
async chess.engine.popen_xboard(command: Union[str, List[str]], *, setp-grp: <math>bool = False, **popen\_args: Any) \rightarrow Tuple[asyncio.transports.SubprocessTransport, <math>chess.engine.XBoardProtocol]
```

Spawns and initializes an XBoard engine.

Parameters

- **command** Path of the engine executable, or a list including the path and arguments.
- **setpgrp** Open the engine process in a new process group. This will stop signals (such as keyboard interrupts) from propagating from the parent process. Defaults to False.
- popen_args Additional arguments for popen. Do not set stdin, stdout, bufsize or universal_newlines.

Returns a subprocess transport and engine protocol pair.

```
class chess.engine.Protocol
```

Protocol for communicating with a chess engine process.

```
id: Dict[str, str]
```

Dictionary of information about the engine. Common keys are name and author.

```
returncode: asyncio.Future[int]
```

Future: Exit code of the process.

```
\textbf{abstract async initialize()} \rightarrow None
```

Initializes the engine.

```
\textbf{abstract async ping()} \rightarrow None
```

Pings the engine and waits for a response. Used to ensure the engine is still alive and idle.

```
abstract async quit() \rightarrow None
```

Asks the engine to shut down.

```
class chess.engine.UciProtocol
```

An implementation of the Universal Chess Interface protocol.

```
class chess.engine.XBoardProtocol
```

An implementation of the XBoard protocol (CECP).

class chess.engine.**SimpleEngine**(transport: asyncio.transports.SubprocessTransport, protocol: chess.engine.Protocol. *.timeout: Optional[float] = 10.0)

Synchronous wrapper around a transport and engine protocol pair. Provides the same methods and attributes as chess.engine.Protocol with blocking functions instead of coroutines.

You may not concurrently modify objects passed to any of the methods. Other than that, <code>SimpleEngine</code> is thread-safe. When sending a new command to the engine, any previous running command will be cancelled as soon as possible.

Methods will raise asyncio. TimeoutError if an operation takes *timeout* seconds longer than expected (unless *timeout* is None).

Automatically closes the transport when used as a context manager.

```
close() \rightarrow None
```

Closes the transport and the background event loop as soon as possible.

```
classmethod popen_uci (command: Union[str, List[str]], *, timeout: Optional[float] = 10.0, de-
bug: bool = False, setpgrp: bool = False, **popen_args: Any) \rightarrow
chess.engine.SimpleEngine
```

Spawns and initializes a UCI engine. Returns a SimpleEngine instance.

```
classmethod popen_xboard(command: Union[str, List[str]], *, timeout: Optional[float] = 10.0,

debug: bool = False, setpgrp: bool = False, **popen_args: Any)

\rightarrow chess.engine.SimpleEngine
```

Spawns and initializes an XBoard engine. Returns a SimpleEngine instance.

Synchronous wrapper around *AnalysisResult*. Returned by chess.engine.SimpleEngine. analysis().

```
chess.engine.EventLoopPolicy() \rightarrow None
```

An event loop policy for thread-local event loops and child watchers. Ensures each event loop is capable of spawning and watching subprocesses, even when not running on the main thread.

Windows: Uses ProactorEventLoop.

Unix: Uses SelectorEventLoop. If available, PidfdChildWatcher is used to detect subprocess termination (Python 3.9+ on Linux 5.3+). Otherwise, the default child watcher is used on the main thread and relatively slow eager polling is used on all other threads.

8.7 SVG rendering

The chess.svg module renders SVG Tiny images (mostly for IPython/Jupyter Notebook integration). The piece images by Colin M.L. Burnett are triple licensed under the GFDL, BSD and GPL.

chess.svg.piece (piece: chess.Piece, size: Optional[int] = None) \rightarrow str Renders the given chess.Piece as an SVG image.

```
>>> import chess
>>> import chess.svg
>>>
>>> chess.svg.piece(chess.Piece.from_symbol("R"))
```

8.7. SVG rendering 59

```
chess.svg.board (board: Optional[chess.BaseBoard] = None, *, orientation: chess.Color = True, last-
move: Optional[chess.Move] = None, check: Optional[chess.Square] = None, arrows:

Iterable[Union[chess.svg.Arrow, Tuple[chess.Square, chess.Square]]] = [], squares:

Optional[chess.IntoSquareSet] = None, size: Optional[int] = None, coordinates: bool

= True, colors: Dict[str, str] = {}, flipped: bool = False, style: Optional[str] = None)

> str
```

Renders a board with pieces and/or selected squares as an SVG image.

Parameters

- board A chess. BaseBoard for a chessboard with pieces or None (the default) for a chessboard without pieces.
- orientation The point of view, defaulting to chess. WHITE.
- lastmove A chess. Move to be highlighted.
- **check** A square to be marked indicating a check.
- arrows A list of Arrow objects like [chess.svg.Arrow(chess.E2, chess.E4)] or a list of tuples like [(chess.E2, chess.E4)]. An arrow from a square pointing to the same square is drawn as a circle, like [(chess.E2, chess.E2)].
- squares A chess. SquareSet with selected squares.
- size The size of the image in pixels (e.g., 400 for a 400 by 400 board) or None (the default) for no size limit.
- **coordinates** Pass False to disable the coordinate margin.
- colors A dictionary to override default colors. Possible keys are square light, square dark, square light lastmove, square dark lastmove, margin, coord, arrow green, arrow blue, arrow red, and arrow yellow. Values should look like #ffce9e (opaque) or #15781B80 (transparent).
- flipped Pass True to flip the board.
- **style** A CSS stylesheet to include in the SVG image.

```
>>> import chess
>>> import chess.svg
>>>
>>> board = chess.Board("8/8/8/8/4N3/8/8/8 w - - 0 1")
>>> squares = board.attacks(chess.E4)
>>> chess.svg.board(board, squares=squares, size=350)
```

Deprecated since version 1.1: Use *orientation* with a color instead of the *flipped* toggle.

class chess.svg.**Arrow** (tail: chess.Square, head: chess.Square, *, color: str = 'green')

Details of an arrow to be drawn.

tail: chess.Square
Start square of the arrow.

head: chess.Square
End square of the arrow.

color: str
Arrow color.

```
pgn() \rightarrow str
```

Returns the arrow in the format used by [%csl ...] and [%cal ...] PGN annotations, e.g., Gal or Ya2h2.

Colors other than red, yellow and blue default to green.

```
classmethod from_pgn (pgn: str) \rightarrow chess.svg.Arrow
```

Parses an arrow from the format used by [%csl ...] and [%cal ...] PGN annotations, e.g., Gal or Ya2h2.

Also allows skipping the color prefix, defaulting to green.

Raises ValueError if the format is invalid.

8.8 Variants

python-chess supports several chess variants.

```
>>> import chess.variant
>>>
>>> board = chess.variant.GiveawayBoard()
```

See chess.Board.is_variant_end(), is_variant_win(), is_variant_draw(), or is_variant_loss() for special variant end conditions and results.

Variant	Board class	UCI/XBoard	Syzygy
Standard	chess.Board	chess/normal	.rtbw, .rtbz
Suicide	chess.variant.SuicideBoard	suicide	.stbw, .stbz
Giveaway	chess.variant.GiveawayBoard	giveaway	.gtbw, .gtbz
Antichess	chess.variant.AntichessBoard	antichess	.gtbw, .gtbz
Atomic	chess.variant.AtomicBoard	atomic	.atbw, .atbz
King of the Hill	chess.variant.KingOfTheHillBoard	kingofthehill	
Racing Kings	chess.variant.RacingKingsBoard	racingkings	
Horde	chess.variant.HordeBoard	horde	
Three-check	chess.variant.ThreeCheckBoard	3check	
Crazyhouse	chess.variant.CrazyhouseBoard	crazyhouse	

chess.variant.find_variant (name: str) \rightarrow Type[chess.Board] Looks for a variant board class by variant name.

8.8. Variants 61

8.8.1 Chess960

Chess960 is orthogonal to all other variants.

See chess.BaseBoard.set_chess960_pos(), chess960_pos(), and from_chess960_pos() for dealing with Chess960 starting positions.

8.8.2 Crazyhouse

```
class chess.variant.CrazyhousePocket (symbols: Iterable[str] = ")
     A Crazyhouse pocket with a counter for each piece type.
     add (piece\_type: int) \rightarrow None
          Adds a piece of the given type to this pocket.
     remove (piece\_type: int) \rightarrow None
          Removes a piece of the given type from this pocket.
     count (piece\_type: int) \rightarrow int
          Returns the number of pieces of the given type in the pocket.
     reset () \rightarrow None
          Clears the pocket.
     copy() \rightarrow CrazyhousePocketT
          Returns a copy of this pocket.
class chess.variant.CrazyhouseBoard (fen:
                                                                    Optional[str]
                                                                                                  'rn-
                                                 bqkbnr/pppppppp/8/8/8/8/PPPPPPPP/RNBQKBNR[] w
                                                 KQkq - 0.1', chess960: bool = False)
     pockets = [chess.variant.CrazyhousePocket(), chess.variant.CrazyhousePocket()]
8.8.3 Three-check
class chess.variant.ThreeCheckBoard (fen:
                                                                                                  'rn-
                                                                    Optional[str]
                                                 bqkbnr/pppppppp/8/8/8/8/PPPPPPPP/RNBQKBNR
                                                 w KQkq - 3 + 301', chess 960: bool = False)
```

8.8.4 UCI/XBoard

remaining_checks = [3, 3]

Multi-Variant Stockfish and other engines have an UCI_Variant option. XBoard engines may declare support for variants. This is automatically managed.

```
>>> import chess.engine
>>>
>>> engine = chess.engine.SimpleEngine.popen_uci("stockfish-mv")
>>>
>>> board = chess.variant.RacingKingsBoard()
>>> result = engine.play(board, chess.engine.Limit(time=1.0))
```

8.8.5 Syzygy

Syzygy tablebases are available for suicide, giveaway and atomic chess.

8.9 Changelog for python-chess

8.9.1 New in v1.2.0

New features:

- Added chess.Board.ply().
- Added chess.pgn.GameNode.ply() and chess.pgn.GameNode.turn().
- Added chess.engine.PovWdl, chess.engine.Wdl, and conversions from scores: chess.engine. PovScore.wdl(), chess.engine.Score.wdl().
- Added chess.engine.Score(*, mate_score: int) -> int overload.

Changes:

- The PovScore returned by chess.pgn.GameNode.eval() is now always relative to the side to move. The ambiguity around [%eval #0] has been resolved to Mate(-0). This makes sense, given that the authors had standard chess in mind (where a game ending move is always a loss for the opponent). Previously this would be parsed as None.
- Typed chess.engine.InfoDict["wdl"] as the new chess.engine.PovWdl, rather than Tuple[int, int, int]. The new type is backwards compatible, but it is recommended to use its documented fields and methods instead.
- Removed chess.engine.PovScore.__str__(). String representation falls back to __repr__.
- The en_passant parameter of chess.Board.fen() and chess.Board.epd() is now typed as Literal["legal", "fen", "xfen"] rather than str.

8.9.2 New in v1.1.0

New features:

- Added chess.svg.board(..., orientation). This is a more idiomatic way to set the board orientation than flipped.
- Added chess.svg.Arrow.pgn() and chess.svg.Arrow.from_pgn().

Changes:

• Further relaxed chess.Board.parse_san(). Now accepts fully specified moves like e2e4, even if that is not a pawn move, castling notation with zeros, null moves in UCI notation, and null moves in XBoard notation.

8.9.3 New in v1.0.1

Bugfixes:

• chess.svg: Restored SVG Tiny compatibility by splitting colors like #rrggbbaa into a solid color and opacity.

8.9.4 New in v1.0.0

See <code>CHANGELOG-OLD.rst</code> for changes up to $v1.0.0.\,$
